

# METHOD STATEMENT

## Determinand:

Extractable Hydrocarbons (EH) C6 - C40

## Matrix:

Raw waters, waste waters, effluents, leachates and non-regulatory drinking water.

## Principle of Method:

Extractable hydrocarbons are extracted from aqueous samples using n-Pentane and are quantified by capillary gas chromatography with flame ionisation detection.

## Sampling and Sample Preparation:

250ml glass bottles should be used, fitted with PTFE lined screw caps.

Samples should be stored at 3 ± 2°C.

Samples must, if at all possible, be extracted in the sample bottles in which they were collected.

Samples are stable for 13 days (In-House Data) from sampling.

## Interferences:

Any co-extracted material which has a retention time in the C6 to C40 range and which elicits a detector response will interfere.

## Performance of Method:

The range of analysis is 10 - 20,000µg/l without dilution

Determinand	LOD µg/l	Low Std		High Std

EH (>C6 - C40)	3.66	9.35	2.63	11.58	6.85	10.86	2.73	11.71

## Uncertainty of Measurement:

The reported uncertainty is an expanded uncertainty calculated using a coverage factor of 2, which gives a level of confidence of approximately 95%.

Determinand	Uncertainty of Measurement %
EH (>C6 - C40)	27.52%
